Pāṇini — feasible design found

7 legs, 3 segs/leg (gait fitness -0.039)

GGE — no feasible design in 60 evals

best genome GGE's own search settled on
(rejected by the feasibility gate)

Seed 3, budget=60 evals, coupled feasibility gate tightened to a 5% pooled pass rate
(same gate every method already respects; top5_feasibility.py). Of the 5 strongest baselines (GGE, PSO, IPOP-CMA-ES, LHS+refinement, random search), only GGE fails at this seed — Pāṇini ties the other three at 100% feasibility across 24 seeds.
